

# **Messungen und Vergleich von Virtualisierungsumgebungen**

Christoph Steindl, am 13.5.2011

# Virtualisation

---

- ▶ **Virtualisation**

- ▶ Virtual representation of a physical thing
- ▶ Needs controlling mechanism to act correct

- ▶ **Hardware virtualisation**

- ▶ Basis to create a virtual machine

- ▶ **Other virtualisation**

- ▶ Memory: virtual memory
- ▶ Storage: distributed file system
- ▶ Network: desktop virtualisation

# Virtualisation - Benefits

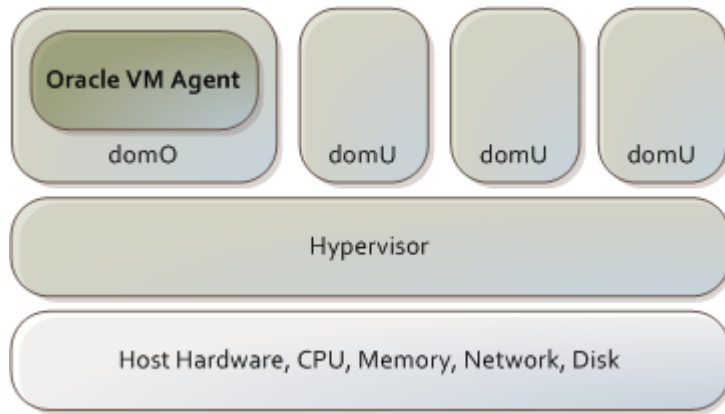

---

- ▶ Multiple OSs
- ▶ No Impact (Guest – Host, Guest – Guest)
- ▶ Reduction of costs
- ▶ Scalability
- ▶ Flexibility

# Structure VM

---

- ▶ Host system: OS with installed hypervisor
- ▶ Guest system: OS using the virtualised hardware
- ▶ Hypervisor: distributes the hardware resources between OSs.

# My goals (1)

---

- ▶ **Implementation of a framework**
  - ▶ Easy to handle
  - ▶ Portability
- ▶ **Test**
  - ▶ Research of tests
  - ▶ Implementation of test frameworks

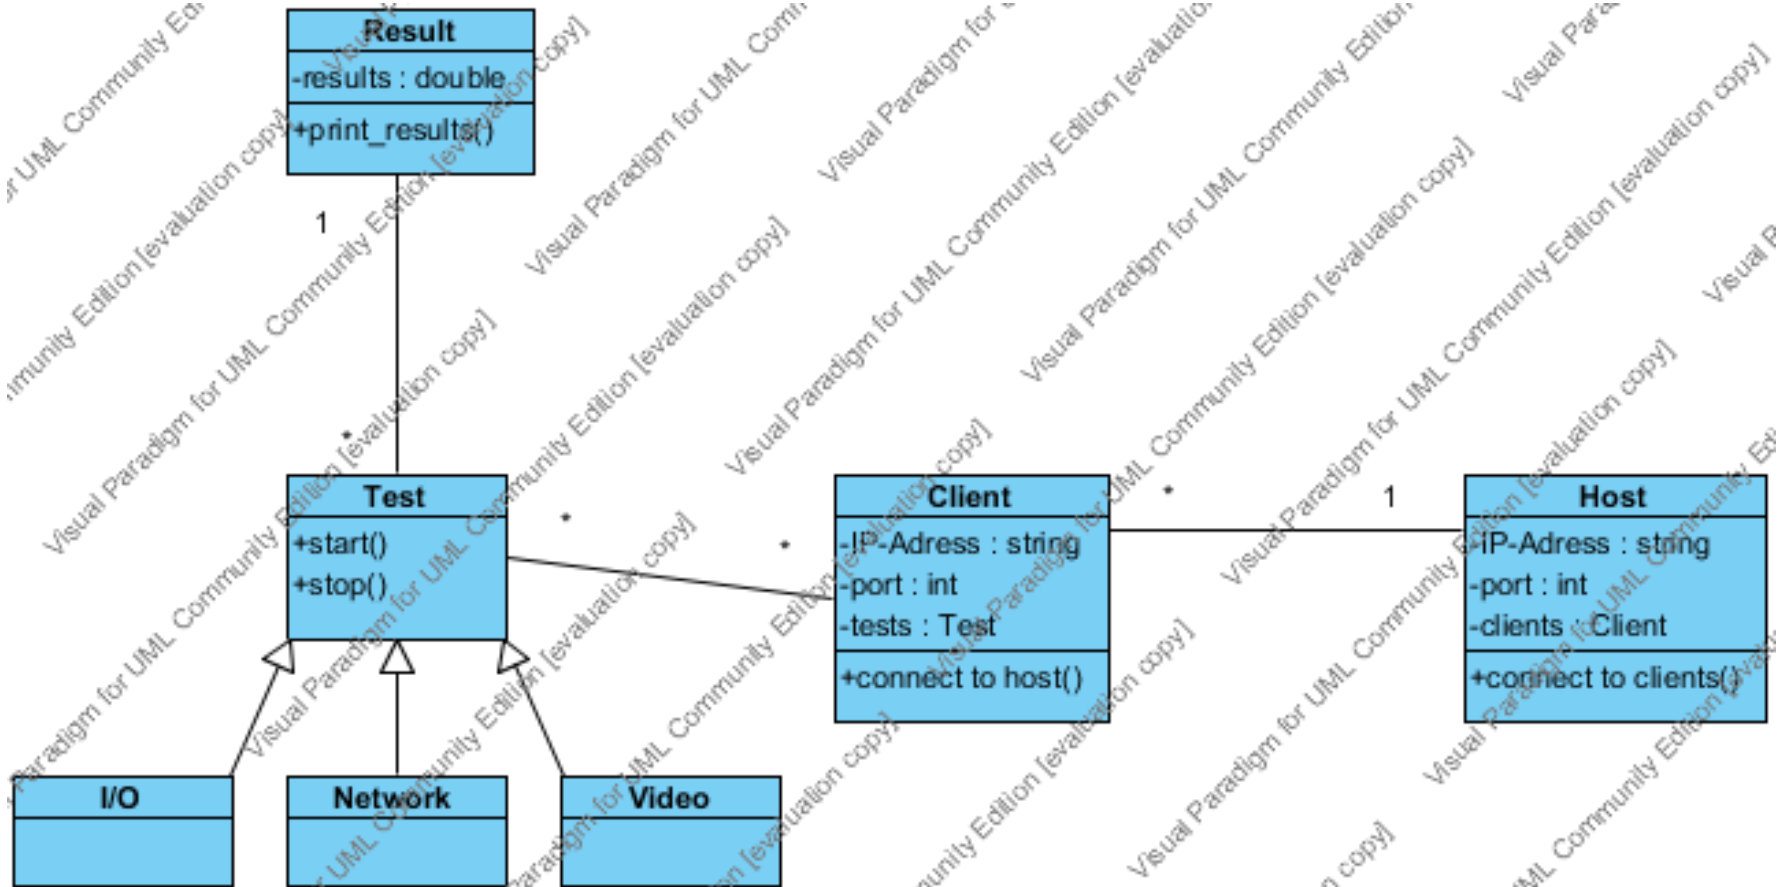

# My goals (2)

---

- ▶ **Perform tests**
  - ▶ Different settings
  - ▶ Different test cases
- ▶ **Evaluate tests**
  - ▶ Get most relevant parameters
  - ▶ Show relations graphically

# Architecture (I)

# Architecture (II)

---

## ▶ Host

- ▶ Supervisor of the test
- ▶ Tells the clients when to perform a test

## ▶ Client

- ▶ Each VM is a client
- ▶ Registers at host
- ▶ On each client a set of tests/benchmarks is installed

## ▶ Test

- ▶ Multiple tests exist testing different fairness qualities of VMM

## ▶ Results

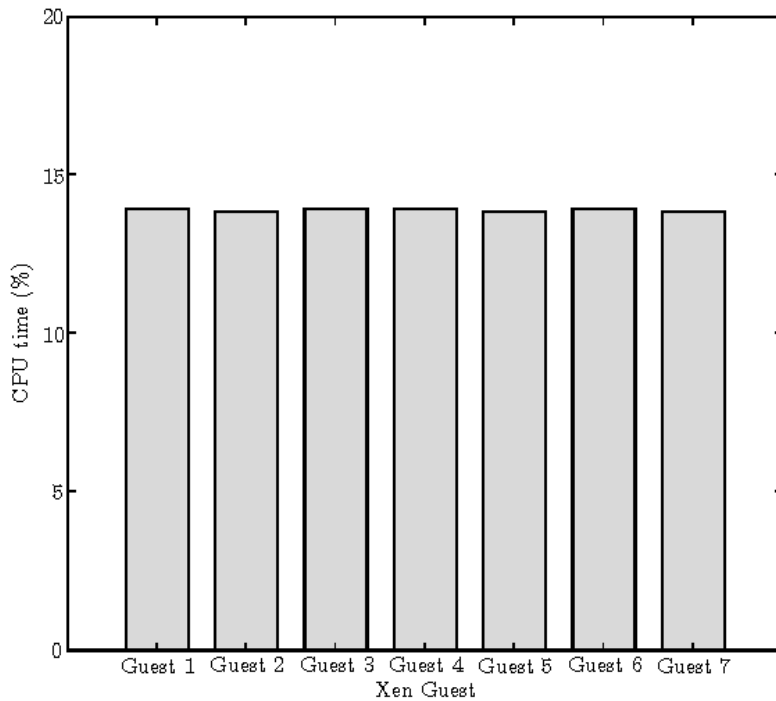

- ▶ Results are collected and sent to host

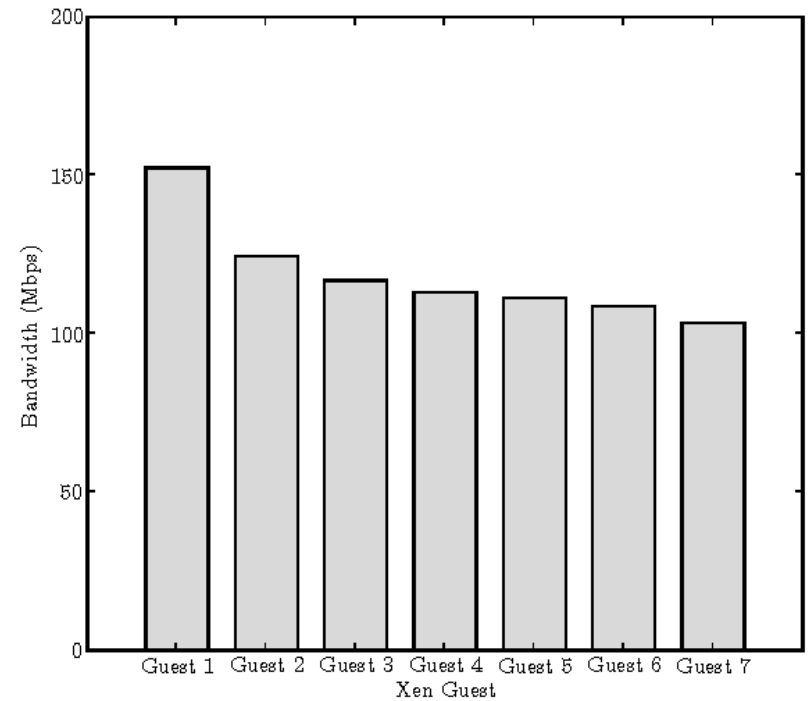

# Why?

---

**Figure 2.** CPU fairness with Xen's default configuration.

**Figure 3.** I/O fairness with Xen's default configuration.

# Why?
